Dear Sirs:

I am presently writing the reference portion of a laboratory manual of physical chemistry in cooperation with the Midwestern Association of Chemistry Teachers in Liberal Arts Colleges. In connection with this I am giving examples of various mechanical linkages by which motion is changed so that it becomes more useful or may be observed with greater clarity.

I would like permission to include in the above discussion a sketch of your Rectiriter mechanism such as is shown on page two of your bulletin No. R-501. Your company will be mentioned in a footnote together with a statement that the system is exclusive and patented. I can see no harm to your interests by this mention and indeed it would seem to our mutual advantage to include this unique system in my discussion. I trust that you will find it possible to grant this request.

Sincerely yours,

William C. Oelke, editor.
